Dictionary Application – Trie Data Structure for Fast Word Search

CSA0315-DATA STRUCTURES

Presented by:

V.MOHAMMAD HUSSAIN(192524179)

Guided by:

Dr .T.RAJESH KUMAR

INTRODUCTION

- A dictionary stores many words.
- We need to search words quickly and correctly.
- A Trie is a data structure used for fast word searching.
- It is commonly used in dictionaries, search engines, and auto-complete apps.

PROBLEM STATEMENT

-
- Large dictionaries contain thousands of words.
 - Searching every word takes more time.
 - Slow search reduces application performance.
 - A faster method is needed to find words quickly.

OBJECTIVES

- To understand the Trie data structure.
- To perform fast word searching in a dictionary.
- To compare Trie with other search methods.
- To improve search speed and support features like auto-complete..

PROPOSED SOLUTION- TRIED DATA STRUCTURE

- Use a Trie to store all words.
- Each letter is stored one by one.
- It helps find words very quickly.
- It is useful for dictionary search and auto-complete.

CONCLUSION

-
- Trie is a simple and efficient data structure.
 - It helps search words quickly.
 - It is used in dictionaries and auto-complete features.
 - Trie improves search speed and user experience
